

The BioMed Network Admission Control (NAC) solution is an effective way for hospitals to automate the process of connecting various biomedical, IT, and guest devices to the network, eliminating a time-consuming manual process. Architected by Nexus in conjunction with Cisco, this technology can automatically distinguish certain biomedical devices and provision the network for the appropriate access capabilities and restrictions. It isolates and protects identified biomedical devices from other hosts on the IP network to protect the devices from malware and provide the appropriate quality of service.

Flexible, Scalable, Secure

BioMed NAC allows healthcare organizations to use a single, unified, and converged IP network to support IT, identified biomedical, and guest devices. With BioMed NAC, caregivers can connect identified biomedical devices to different bedside wall jacks, bringing needed devices directly to the patient rather than the reverse and improving the speed and quality of care. The network securely automates device assignments to controlled zones on the network and isolates and protects the biomedical devices from other hosts on the network, ensuring fast, secure connections. A graphical interface provides reporting and visibility, sending event changes to a central network management pane.

Nexus Core Foundation Services

Designed to help healthcare organizations increase the quality of patient care and improve productivity while meeting the security, availability, and resiliency needs of the healthcare industry, Nexus Core Foundation Services utilize advanced technologies from Cisco and other industry leaders. As part of the Core Foundation Services offering, Biomed NAC helps:

- Protect and isolate identified biomedical devices from other hosts on the network
- Deliver real-time inventory and asset-tracking for a variety of endpoint devices
- Allow more mobility for devices to be brought to the patient, improving patient care
- Provide flexible biomedical, IT, and guest access on all ports where necessary
- Improve operational efficiencies and reduce expenses by automating access control and monitoring
